FOCUS GASTROENTEROLOGY

16 April 2026

Dr Jane Healy
Glen Iris Medical Group

Dear Dr Healy,

Re: Ms Kate Gengoult-Smith
DOB: 1976-03-31
Address: 1 Boyanda Road, GLEN IRIS VIC 3146

Summary

- ***Recent exacerbation of gastrointestinal symptoms including intermittent diarrhoea and abdominal cramping.***
- ***Evaluation for a potential flare of Crohn's disease versus functional symptoms related to significant psychosocial stressors.***
- ***Investigations ordered including faecal calprotectin and inflammatory markers.***
- ***Prescription provided for metaclopramide to manage nausea.***
- ***No action required by you.***

I had the pleasure of conducting a review with Kate Gengoult-Smith via telehealth. Kate requested an earlier appointment due to a recent increase in her symptoms and associated concerns regarding her bowel health.

She described a recent change in her bowel habit, characterised by intermittent loose stools and episodes of abdominal cramping. This culminated yesterday in four episodes of diarrhoea over a three-hour period. Kate also noted occasional minor haematochezia on wiping, which she had previously attributed to constipation and possible friable skin. She reports significant associated nausea and exhaustion.

We discussed these symptoms in the context of her significant current psychosocial stressors, including home renovations and family issues, which may be contributing to a functional exacerbation. However, given her history, a flare of her inflammatory bowel disease must be

excluded. It is worth noting that Kate has undergone endoscopic evaluation within the last twelve months, which was reassuring and makes the probability of a malignant process extremely low.

Impression and Plan My clinical impression is that while these symptoms may be functional or related to a transient viral illness, we must objectively exclude a Crohn's flare. I have requested an urgent faecal calprotectin alongside blood investigations, including a full blood examination, urea and electrolytes, liver function tests, and C-reactive protein.

I have advised Kate to maintain her usual diet for the time being. I have also provided her with a prescription for ondansetron to assist with her nausea. I have scheduled a review with Kate for next week to discuss the results of her investigations and determine the most appropriate management strategy moving forward.

Yours sincerely,

A/Prof Chamara Basnayake
