Dr Damian Bradley
Fitzroy North Medical Clinic

Dear Dr Bradley,

Re: Mr Joseph McGirr
DOB: 02/02/1996 Phone: 0413 416 228
Address: 505 / 58 Queens Road, FITZROY NORTH, VIC, 3068
Email: joemcgirr89@gmail.com

Summary

- **Likely chronic ulcerative proctitis with symptomatic relapse following cessation of induction therapy.**
- **For repeat stool specimen followed by re-induction with Predsol suppositories.**
- **Transition to long-term maintenance suppositories thereafter.**
- **No action required by you.**

I had the pleasure of conducting a review with Joseph McGirr. As you are aware, we had previously initiated a two-month course of Predsol suppositories for suspected ulcerative proctitis. Joseph reports that while the treatment was instantly effective, his symptoms deteriorated shortly after the course was completed.

He is currently opening his bowels three to four times per day. He notes that more than half of these movements contain blood and mucus. He denies any faecal incontinence, rashes, or joint pains. Given the prompt recurrence of symptoms once the prednisolone-based suppositories were ceased, I believe it is increasingly likely that Joseph has developed a chronic inflammatory bowel disease rather than a transient or self-limiting proctitis.

We discussed the role of lifestyle factors in managing this condition. I have advised him to minimize his intake of processed foods and, importantly, I have recommended smoking cessation, as this can be a trigger for inflammatory activity. We also discussed that while alcohol may cause some symptomatic looseness of the stool, it is unlikely to be the primary driver of his underlying inflammation.

Impression and Plan I have asked Joseph to provide a stool specimen to objectively confirm active inflammation before we recommence therapy. Once the sample is collected, he will restart Predsol suppositories for a further two months to achieve symptomatic control. Following this, I intend to transition him to a milder maintenance suppository to mitigate the risk of further relapse (5 ASA mesalazine suppositories)

I have provided Joseph with the necessary pathology request and a new prescription for Predsol. I plan to review him in approximately four to five months, at which time he will repeat the stool specimen so we can assess his biochemical response to maintenance therapy. I have instructed him to contact me sooner should his symptoms fail to settle.
